VISNAV Exercise05

Yiğit Aras Tunalı

April 2021

    The main difference between the optimization in SFM to this one is the use of multithreading. While bundle adjustment is happening the next steps in the new frames like detection etc are being done in parallel. The opt_finished and opt_running control the joining of threads. If opt_finished is true and opt_running is false the thread is finished and the join function is called.
